Tricorder Data Systems (TDS) Joins Motorola PartnerSelect Program

Baltimore, MD (October 1, 2009) — Tricorder Data Systems, Inc., (TDS) announced today that it has become a member of Motorola's PartnerSelect Independent Software Vendor (ISV) Program. TDS will offer its software products that perform remote personnel and asset tracking/accounting, radiation detection and sub second image transfer on Motorola MC75 Enterprise Digital Assistants (EDA) and other Motorola mobile computers.

TDS' **Radiation Scout**^{TM} and **Emergency Management Incident Tracking System** (**EMITS)** is designed for interoperability with Motorola's MC75 EDA. These intuitive TDS mobile software products are enabled with database harvesting, scanning, real-time/secure/wireless data transfer, and image analytical capabilities. Radiation Scout^{TM} represents a new, novel approach to radiation detection. It uses a technique that measures gamma ray hits as they interact with a digital camera's Complementary Metal Oxide Semiconductor (CMOS) imaging chip. The Emergency Management Incident Tracking System (**EMITS**) software provides the first integrated tracking system for managing field personnel and assets in real-time. **Picture Express**^{TM}, which was designed to organize, transfer, store and provide advanced analysis on digital pictures in a real-time mobile environment, has also been optimized for use on the MC75 and other Motorola mobile computers.

"By joining Motorola's PartnerSelect ISV program, we expect to benefit from Motorola's vast partner ecosystem and significantly improve our time to market delivering vertical solutions that customers demand," said Ray Blankenheim, President of TDS.

TDS was formed as a partnership between Virginia based Caelum Technology and Baltimore based Waterfront Technologies. Additional products and services in the areas or radon detection, facial recognition and coherent change detection are currently being planned for release in 2010.
